Birds, reptiles, rodents, and other exotic pets are popular in many households. However, these pets frequently carry *Salmonella* and other harmful bacteria in their feces that can make people sick. Some pet birds may also carry a germ that can cause psittacosis (parrot fever) in people.

- Wash your hands with soap and warm water after handling these pets, their bedding or food, and after touching cages.
- Don’t nuzzle or kiss them.
- Keep them in their habitat or cage. Don’t let them roam around.
- Never clean cages or equipment in the kitchen sink or where food is prepared. If you use a bathtub, disinfect it with bleach afterwards.

**REMINDER!**
Children should always be supervised when handling pets.

It’s no secret that Americans love their pets. The majority of U.S. households have pets, and the percent is increasing. In King County, 40% of households include a dog and 45% have one or more cats—for a total of over a half-million dogs and nearly 800,000 cats. Many other types of pets are kept as well, even chickens and mini goats in Seattle and many parts of the county.

The health benefits of pets are well known. Pets increase opportunities for exercise and socializing, and their companionship decreases feelings of loneliness. Pets can be beneficial to children’s growth and development. Owning a pet has even been shown to lower blood pressure and cholesterol!

While the benefits are many, it is also important to take precautions to minimize the risk of disease transmission from pets to people (zoonotic disease). This brochure will help people stay healthy around their pets.

Some people are more likely to get diseases from animals because of weaker immune systems, including:
- organ transplant recipients
- people on cancer treatment or other therapy that suppresses the immune system
- people with AIDS
- elderly people
- pregnant women
- children under 5 years of age

If you or anyone in your family is at higher risk of zoonotic disease, talk to your doctor and veterinarian about precautions to take.

**High Risk Pets**

People at higher risk should avoid:
- Reptiles and amphibians such as lizards, snakes, frogs & turtles
- Baby chicks & ducklings
- Exotic pets like hedgehogs
- Sick animals, especially those with diarrhea
- Pregnant women should also avoid hamsters and mice due to the risk of lymphocytic choriomeningitis virus (LCMV) infection that can harm the unborn baby.

**Tips for dog & cat owners**

- Deworm puppies and kittens to eliminate parasites that are harmful to your pet and may also infect people, especially children.
- Remove pet feces every day to prevent the spread of parasites.
- Control fleas and ticks! They can spread disease to people and are harmful for your pet.
- Get dogs and cats vaccinated against rabies by 4 months of age and maintain boosters. It’s the law in King County!
- Don’t feed raw meat diets. They can spread intestinal infections to you and your pet.
- Keep pets away from wildlife that may spread diseases.
- Reduce the risk of bites and scratches: socialize and train your pet to be a “good citizen”.

REMINDER!

See your veterinarian regularly to maintain your pet’s good health.
