## **Cedar Hills Regional Landfill Summary of Quarterly Environmental Monitoring Third Quarter of 2015**

This summary contains a discussion of quarterly environmental monitoring results for groundwater and surface water quality and landfill gas migration monitoring for Cedar Hills Regional Landfill.

Environmental samples were collected and analyzed in accordance with the Quality Assurance Project Plan for Environmental Monitoring at King County Solid Waste Facilities (QAPP). This document contains procedures to ensure data quality, consistency and documentation.

### **1.0      Quarterly Results and Analysis**

This Section discusses the monitoring results and how they compare to previously collected data at the site.

#### **1.1      Groundwater**

Groundwater monitoring well details and locations are presented in Table 1 and Figure 1. Monitoring activities for the third quarter are listed in Table 2.

##### **1.11      Regional Aquifer**

Regional aquifer analysis results for this quarter are consistent with past results.

For discussion and graphical presentation, monitoring wells are grouped together according to the flow path analysis for the regional aquifer.

Groundwater elevations and potentiometric surfaces are within historical ranges and reflect seasonal responses to precipitation. Potentiometric Surface Map and Groundwater Flow Analysis can be found in Appendix A. Elevations measured this quarter conform to the current hydrogeologic model.

Exceedances of regulatory standards are tabulated and presented in Table 3. Groundwater samples were analyzed for both dissolved and total metal fractions per WAC 173-351-430(2)(b)(ii) as revised. Results for metals listed in WAC 173-351-990 Appendix I were compared to water quality standards. This has resulted in more exceedances for arsenic but does not indicate a change in water quality as the dissolved concentrations remained similar. These results reflect the change in analytical procedure.

Primary Ground Water Quality Criteria were exceeded for total arsenic in upgradient and crossgradient wells MW-93, MW-21 and MW-99. Wells interior or vertical to facilities MW-64 and MW-68; and downgradient wells MW-69, MW-80, MW-86, MW-87, MW-89 and MW-91 also exceeded the standard for arsenic. The change to a comparison of Appendix I metals to standards using the total fraction leads to concentration increases as a result of dissolving particulates in the sample rather than filtering them out. This was an expected result of the methodology change.

Trichloroethene exceeded the groundwater criterion in upgradient wells MW-76 and MW-82; and vinyl chloride exceeded criteria in MW-65. Secondary standards (dissolved iron and dissolved manganese) were exceeded in numerous regional wells. These results are consistent with past analyses.

Trilinear Diagrams (Figures 2 through 6) indicate water quality type (hydrochemical facie) based on dissolved ion distribution. The diagrams are useful to recognize spatial variability, potential analytical error or change in hydrochemical facie over time. All regional samples are within the calcium-magnesium-bicarbonate hydrochemical facie. Data are consistent with previous quarters. Ion balance calculations (Table 4) indicate no analytical error in regional aquifer samples as all samples are within 10% on the ion balance.

Intra-well prediction limits are calculated annually using data collected through the end of the previous calendar year (2014). Comparison to calculated prediction limits provides an indication of whether a change in concentration represents normal variability or a change in water quality. This quarter, nitrate in upgradient well MW-94 exceeded prediction limits (Table 5). Adequate background data sets for total metals have now been collected and used to establish initial prediction limit values for Appendix I metals. These calculations indicate limit exceedances for arsenic and barium in down gradient well MW-80. These results will be evaluated per the protocol described in the *Environmental Monitoring Sampling and Analysis Plan for Cedar Hills Regional Landfill*.

Volatile Organic Compound (VOC) detections in regional aquifer wells are presented in Table 6. Present are regularly occurring detections of chlorinated VOCs and their breakdown products from the upgradient Queen City Farms (QCF) Site, which include trichloroethene (TCE) in monitoring wells MW-76, MW-82, MW-83, and MW-94; *cis*-1,2-dichloroethene detected in MW-24, MW-56, MW-59 and MW-76; tetrachloroethene (PCE) in MW-76 and vinyl chloride (VC) in MW-65. These upgradient well detections are consistent with past data and continuing migration from QCF.

Methylene chloride and chloromethane were detected in field, trip and method blanks as well numerous groundwater samples. Acetone was detected in field and method blanks, and styrene and toluene in one field blank. All of these detections are attributable to blank contamination or preservation artifacts. Quality Assurance /Quality Control (QA/QC) samples (field blanks, trip blanks, and method blanks) detections appear in Table 13.

## 1.12 Perched Zones

Analysis results for the perched zones this quarter are consistent with past results.

Groundwater elevations measured during the quarter are within historical ranges. Samples were collected from six perched wells, three in the north and west areas of the

landfill (MW-27A, MW-29, and MW-55), two in the east perched zone (MW-30A and MW-47); and MW-101 in the South Solid Waste Area. Wells MW-28, MW-62 and MW-EB6 were not sampled due to seasonally low water levels. Groundwater quality data for the regularly sampled Perched Zone samples collected during the third quarter of 2015 are consistent with previous samples.

Exceedances of regulatory standards are tabulated and presented in Table 7. All are consistent with past analyses and known impacts.

Trilinear plots for perched zones samples are all within the calcium-magnesium-bicarbonate hydrochemical facie, as in past samples (Table 8 and Figures 7-9). Cation/Anion balances indicate potential analytical error (greater than 10% ion imbalance) only in perched well MW-62.

As with the regional data, perched zone prediction limits are derived from cumulative data through the end of 2014 and any exceedances of these limits by current results are tabulated (Table 9). There were no prediction limits exceedances in the perched zone.

Volatile Organic Compound detections in the perched zones are presented in Table 10. All are consistent with previous analyses.

## **1.2 Surface Water**

Surface water sampling is attempted monthly at stations located along the drainage courses around the landfill. Only 5 surface water stations had adequate flow during the third quarter to collect samples. Monitoring activities are listed in Table 11.

Cedar Hills Regional Landfill is covered by an Industrial Stormwater General Permit issued by the Washington State Department of Ecology. The permit defines discharge Benchmarks, applicable to all facilities and Effluent Limits, applicable specifically to landfills. These values are reproduced in Table 15. Stations SW-N4, SW-SL3 and SW-GS1 are the designated points for comparison to permit benchmarks and effluent limits. Samples were obtained from designated compliance stations SW-GS1 and SW-SL3 this quarter. The benchmarks for turbidity and copper were exceeded for the August sample at SW-GS1. No effluent limits were exceeded (Table 12).

## **1.3 Landfill Gas**

A network of compliance probes are monitored for landfill gas migration around the perimeter of the landfill. Probes are monitored by the landfill gas crew monthly to monitor system performance and quarterly for compliance. No compliance probes exceeded the 5% criteria this quarter.

Detections above the regulatory limit in landfill gas probe GP-33C in September of 2011 prompted actions including: monitoring frequency increases, operational adjustments to increase LFG recovery rates, off-site structure monitoring and preparation of a response plan.

Operational review resulted in modifications to enhance extraction from unlined areas and under liner spaces that could potentially act as gas conveyance pathways.

The plan resulted in installation of 13 borings targeting the potential zone of LFG migration in the native sediments. Eight borings serve as LFG extraction wells and five as monitoring probes. The extraction wells and probes are currently monitored bimonthly. Methane was not detected in any migration monitoring probe during the second quarter.

Data indicate the system has been effective in controlling LFG migration to the perimeter probes with no methane detections this quarter.

Compliance Probes, On-site Buildings and supplemental Monitoring Probe results are presented in Appendix B.

## **2.0                  Analytical Methods**

Groundwater quality is evaluated by comparison of analysis results to regulatory standards, geochemical analysis and statistical evaluation. Water quality analytical results for surface water runoff discharged from the landfill site are compared to the limits set in the Industrial Stormwater General Permit. Following is a brief description of each.

### **2.1        Regulatory Standards**

Groundwater monitoring results are compared to Washington State Groundwater Quality Criteria, WAC 173-200 (Table 14). Surface water monitoring results are compared to the *Industrial Stormwater General Permit* Benchmark Criteria or WAC 173-201A Water Quality Standards for Surface Waters of the State of Washington.

### **2.2        Trilinear Diagrams and Major Ion Balance**

Geochemical data are presented on trilinear diagrams. Major cations and anions are plotted on individual triangles as percentages of total milliequivalents per liter (meq/L). These diagrams illustrate differences in major ion chemistry between groundwater samples and can be used to categorize water composition into identifiable groups or hydrochemical facies. These hydrochemical facies reflect distinct compositions of cation and anion concentrations. The value of the diagram lies in pointing out relationships that exist among individual samples. Trilinear Diagrams are included with ionic balance calculations in this report. Ion balance calculations are useful for determining analytical correctness and can be of value in detecting laboratory error or variation in field sampling procedures.

### **2.3        Prediction Limits**

The Prediction Limit is an intra-well statistical test that compares an analytical result to a computed limit value. The limit value is derived from past analytical results from the same well, considered representative historical well data. A value outside of this

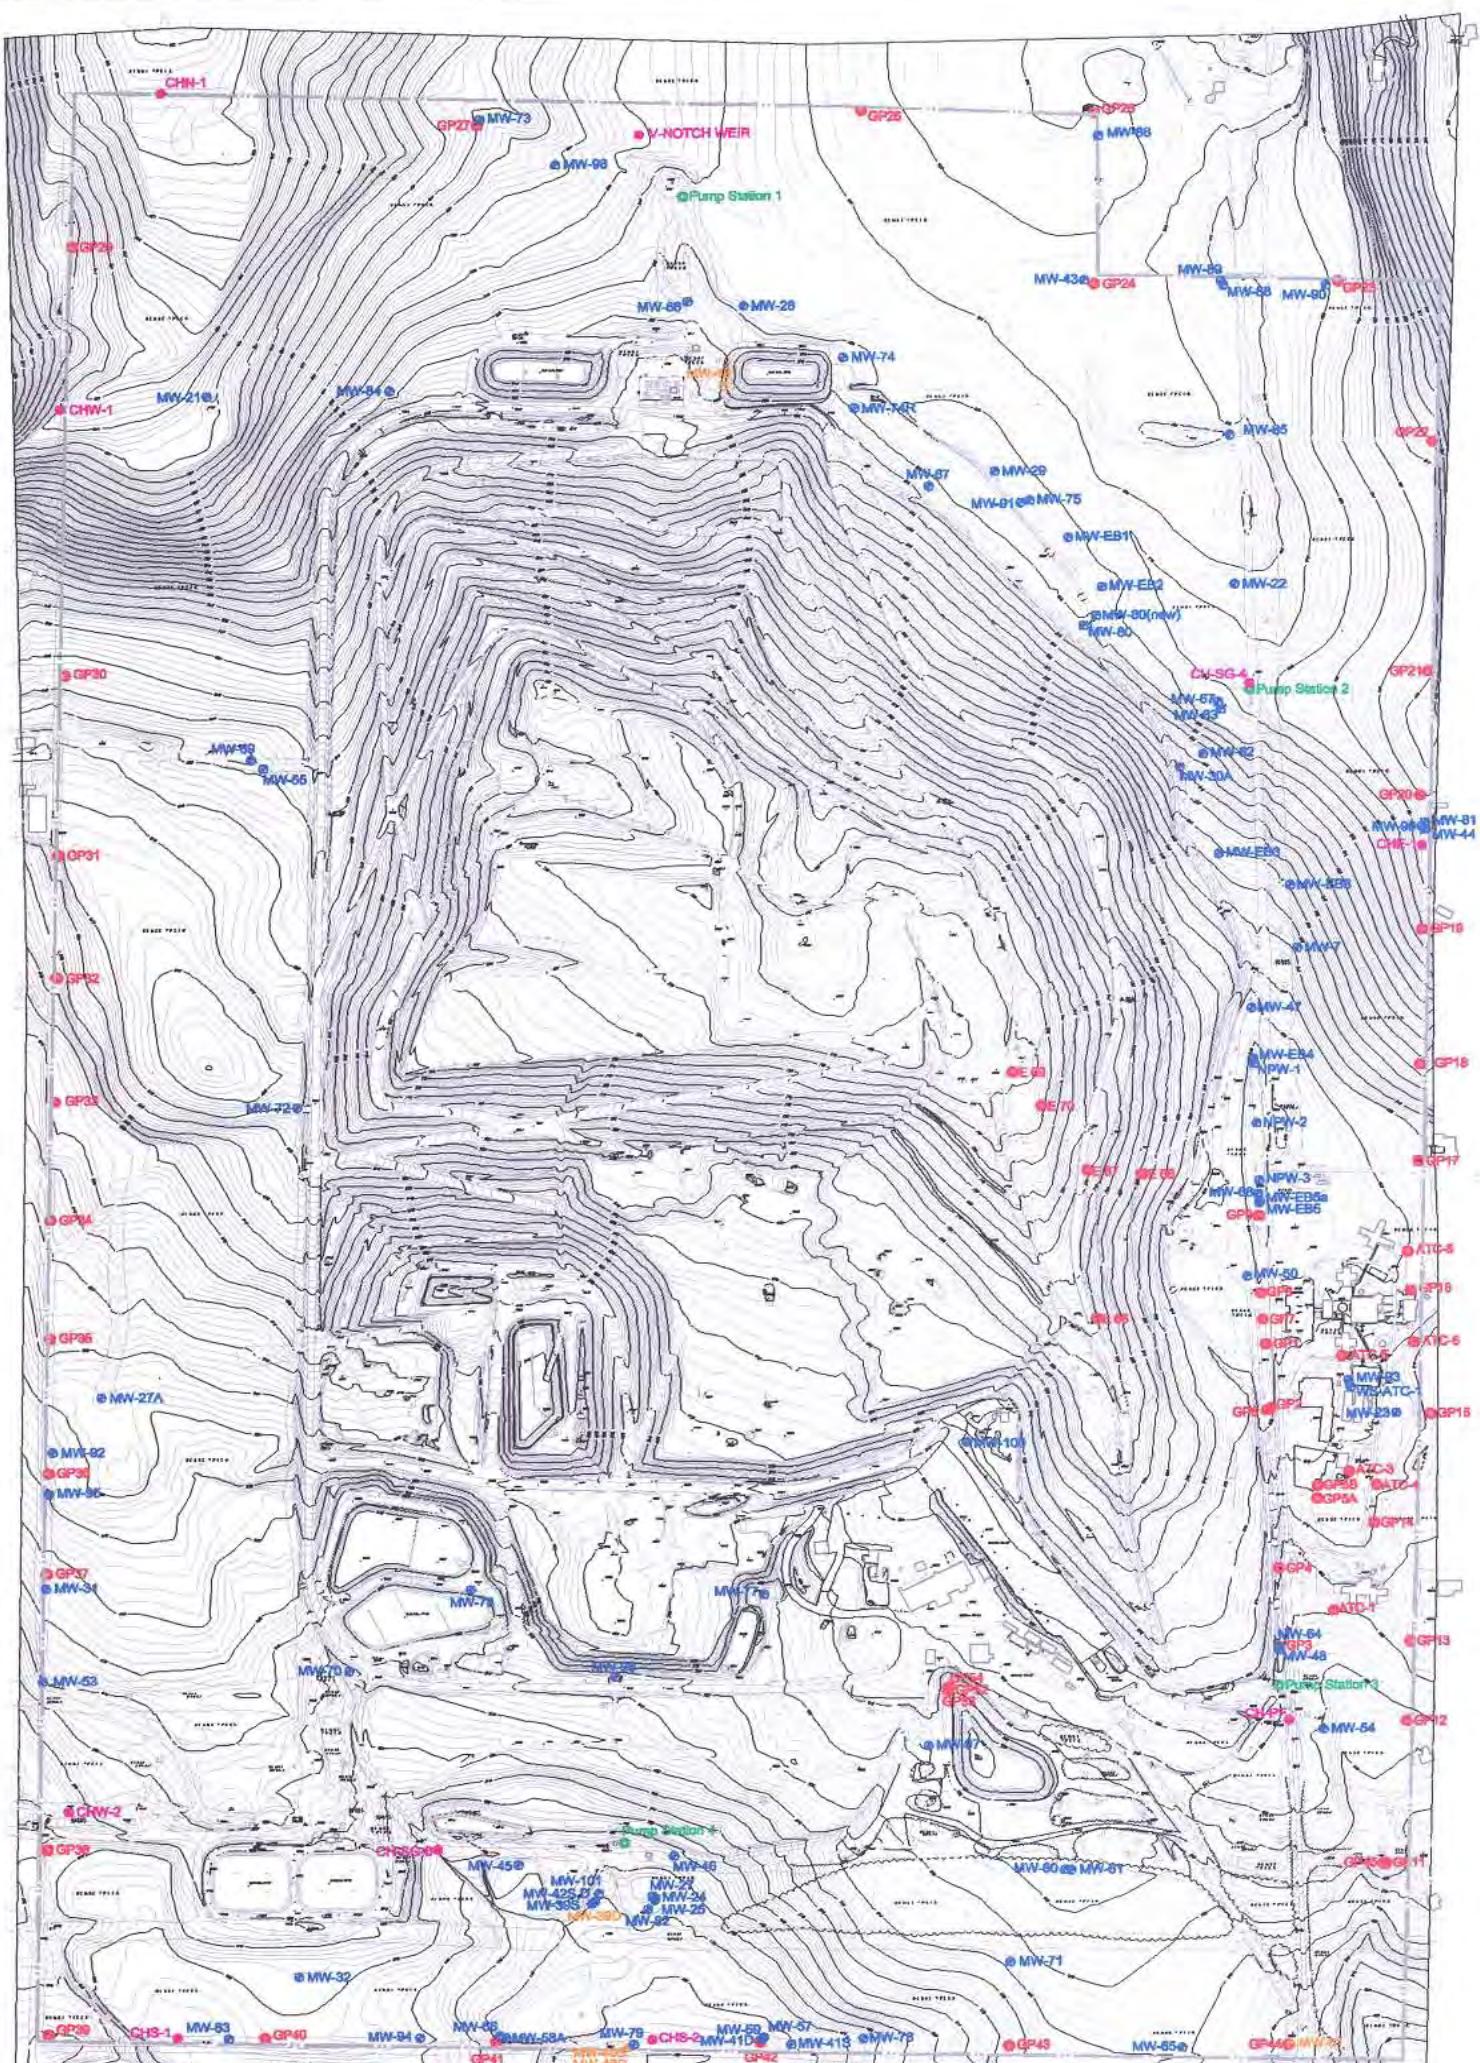

limiting value is considered evidence that the result is not drawn from the same sample population distribution. The prediction limits generated in this report are based on a 1% false positive rate (type I error) and depend on the background distribution. For each parameter tested, an appropriate background data set is chosen. This background set is updated annually to include recent data that more accurately defines background water quality. The data set is tested for normality by application of the Shapiro-Wilk Test for Normality. If the data fail the test for normality, log transformed data are tested. When normal or transformed normal data sets are determined, a parametric prediction limit is calculated and future results compared to this value. When transformations fail the test for normality, a non-parametric method is applied and future results are compared to this limit.

This test is performed on parameters listed in WAC 173-351-990 Appendix I and is used to detect a change in the population distribution of the individual well. Exceedances detected in Appendix I parameters for the quarter are presented in Table 5 (Regional Aquifer Wells) and Table 9 (Perched Zones Wells).

## **2.4      Laboratory Data Quality**

Laboratory analytical data is reviewed to verify meeting data quality objectives (DQOs) as defined in the Quality Assurance Project Plan for Environmental Monitoring at King County Solid Waste Facilities (QAPP). Occasionally, results identified during this process are deemed to be unsuitable for evaluation purposes. A summary of suspect results can be found in Table 16.

RE: Potentiometric Groundwater Surface Maps & Groundwater Velocity Calculations  
Third Quarter 2015 Results  
Cedar Hills Landfill, King County, Washington  
Project No. 1033379 – Task 02.14.137.20

---

The King County Water and Land Resources Division (KCWLR Division) submits this memorandum report on groundwater conditions during the third quarter of 2015 for the Cedar Hills Landfill (landfill), in accordance with the *Proposal for Potentiometric Groundwater Surface Maps & Groundwater Velocity Calculations* (KCWLR Division, 2013). King County Solid Waste Division (KCSWD) personnel measured groundwater elevations at the landfill on July 1, 2015. These measurements were received by KCWLR Division on September 28, 2015 and were used to:

1. Evaluate the potentiometric groundwater surface elevation for the regional aquifer;
2. Determine the groundwater flow direction and horizontal gradient for the regional aquifer; and
3. Calculate the groundwater velocity of the regional aquifer.

There have been no significant changes in the interpreted groundwater conditions since the report submitted for the second quarter of the 2015 monitoring event.

## **Groundwater Elevation Data**

KCSWD attempted groundwater level measurements at 41 monitoring wells during the third quarter of 2015. These wells were completed in the regional aquifer as referred to in

*Potentiometric Groundwater Surface Mapping and Groundwater Velocity Calculation – Cedar Hills Landfill (Aspect, 2010).*

Table 1 lists the well identifications, locations, well details, measured groundwater levels and calculated groundwater elevations for the regional aquifer. Wells with screened intervals within ten feet of the water table were used for potentiometric surface mapping purposes. A total of 24 wells with water levels within ten feet of the top of screen were selected.

Figure 1 shows well locations, groundwater elevations at the 24 selected wells, groundwater potentiometric surface contours, and interpreted groundwater flow direction in the regional aquifer for the July 1, 2015 measurement event.

### **Direction of Groundwater Flow**

Figure 1 shows interpreted groundwater potentiometric surface contours and groundwater flow directions in the regional aquifer, based on the July 1, 2015 measurements. Groundwater elevations indicate that groundwater in the regional aquifer generally flowed north beneath the southern and central portions of the landfill with minor components of flow to the north-northwest and north-northeast. At the northern end of the landfill, groundwater generally flowed to the north and north-northeast.

### **Groundwater Parameters**

Horizontal groundwater velocity was calculated using the following formula:

$$\text{where: } v = \frac{I}{n_{eff}} K \frac{\Delta H}{\Delta L}$$

$v$  = Groundwater velocity [L/t]

$n_{eff}$  = Effective porosity [dimensionless]

$K$  = Hydraulic conductivity [L/t]

$\frac{\Delta H}{\Delta L}$  = Hydraulic gradient [L/L]

Horizontal groundwater velocity was calculated for the regional aquifer below the landfill. Horizontal groundwater velocity was calculated for the southern, central, and northern portions of the regional aquifer, based on spatial differences in aquifer parameters and hydraulic gradients. The hydraulic conductivity and effective porosity values were based on the range referred to in the *Potentiometric Groundwater Surface Mapping and Groundwater Velocity Calculation – Cedar Hills Landfill (Aspect, 2010)*.

Table 2 presents a summary of the groundwater parameters used to calculate a groundwater velocity from the third quarter 2015 data. The hydraulic gradient was greatest under the southern portion of the landfill and smallest under the northern portion. On July 1, 2015, average horizontal groundwater velocity within the regional aquifer ranged from 0.009 feet per day (ft/d) under the southern portion of the landfill to 2.6 ft/d under the central portion of the landfill.

**KING COUNTY SOLID WASTE DIVISION**  
**QUALIFIER INFORMATION**  
*(Effective 8/27/2015)*

QUAL	QUALIFIER DESCRIPTION
U	Undetected; Analyte Concentration Less than Method Detection Limit (< MDL)
T	Estimated; Less than Reporting Detection Limit (<RDL) but Greater than Method Detection Limit (> MDL)
J	Reported Value is an Estimate
B	Matrix Target Analyte Present in Blank, AND, Sample Result Less than or Equal to 10x Blank Detection
C	Confluent Growth
E	Estimated; Outside Expected Accuracy
H	Exceeds Holding Time
R	Data Rejected
S	Sample Handling Errors
X	Too Numerous to Count
D	Re-analysis Due to Dilution
P	PASS – Qualitative Result Acceptable
F	FAIL – Qualitative Result is not Acceptable
G	Estimated with Low Bias (Coliform; BOD; All Other Chemistry Parameters)
L	Estimated with High Bias (BOD; All Other Chemistry Parameters)

**AREA 5 TOP DECK MONITORING  
QUARTERLY REPORT**

**THIRD QUARTER 2015**

This report provides the quarterly performance analysis of the interim soil cover system over Area 5 in the Cedar Hills Regional Landfill. The intent of the report is to provide the necessary information to determine whether the top deck cover system is functioning as designed. Monitoring of leachate, stormwater and the top deck surface is conducted and reported to identify any problems so that they may be corrected in a timely manner and the environment protected from potential harmful impacts.

**I. LEACHATE MONITORING**

**Overview of the Top Deck Monitoring Program**

King County Solid Waste Division (KCSWD) is currently experiencing technical issues with the leachate volume monitoring system for Area 5. Work is underway to resolve these issues and the logged data will be reported as it becomes available in subsequent Top Deck Monitoring Reports.

KCSWD staff continues to evaluate leachate volumes collected throughout the landfill that are pumped to the wastewater treatment plant. Comparisons of the historical volumes generated through typical landfill construction and closure with the phased closure and interim top deck cover utilized in Area 5 have been made. These comparisons provide an initial assessment of the interim cover performance. The evaluation accounts for variations in rainfall by normalizing the leachate flows in terms of gallons discharged per inch of rainfall. The flow is also normalized relative to pounds of waste in-place. These normalized flows for the entire site are presented in Table 1.

**TABLE 1**  
**CEDAR HILLS REGIONAL LANDFILL LEACHATE PRODUCTION for 3<sup>RD</sup> QUARTER of 2015**

Year	Leachate	Surface Area of Refuse Areas	Refuse In Place	Precipitation	Flow			
					(MG/yr)	(Acres)	(lbs)	(in/yr)

2015: Precipitation, leachate and refuse in place through 3<sup>RD</sup> Quarter of 2015

\* The 353.12 acre value was a plan view area calculated by ACAD, using the area inquiry feature of a closed polyline.

## **II. SURFACE MONITORING**

KCSWD's plan for monitoring the surface of the Area 5 Top Deck is comprised of three components:

1. Landfill gas inspections, including a serpentine walk;
2. Leachate seep inspections; and,
3. Settlement monitoring.

The purpose of this monitoring is to detect any conditions affecting the cover system that may permit landfill gas emissions, leachate seeps, or excessive or differential settlement.

### **Landfill Gas Inspections**

Each quarter, monthly inspections of the gas system, stormwater system, and cover system of Area 5 are performed by the Solid Waste Operations (SWO) staff. All internal inspection reports showed satisfactory conditions this quarter. These inspection reports are included in Appendix A: *Inspection Reports*.

Also throughout the 3<sup>rd</sup> Quarter, Facility Engineering and Science (FESU) staff performed monthly Landfill Facility Site Inspections. These inspections are also included in Appendix A: *Inspection Reports*.

During the 3<sup>rd</sup> Quarter of 2015, no inspections were performed by Public Health – Seattle & King County (PHSKC).

### **Serpentine Walk**

Each quarter, serpentine walks are conducted across the Area 5 Top Deck and its side slopes to verify that methane gas levels in the air column do not exceed air quality standards. The results from the 3<sup>rd</sup> Quarter Serpentine Surface Monitoring Data walk that was conducted from September 14<sup>th</sup> to the 22<sup>nd</sup>, 2015 can be found in Appendix B: *Gas Monitoring Reports*, along with a plot of GPS generated track lines.

For the 3<sup>rd</sup> Quarter of 2015, no exceedances were detected during the serpentine walk for air quality standards.

### **Leachate Seep Inspections**

Visual inspections for leachate seeps are conducted each quarter by KCSWD personnel in conjunction with the surface emissions monitoring and monthly inspections. No indications of leachate seeps were recorded during the 3<sup>rd</sup> Quarter of 2015 by KCSWD staff, or by PHSKC personnel.

### **Settlement Monitoring**

Settlement of Area 5 is evaluated both through visual inspections and through topographic surveys at control points on the top deck. A site map showing the settlement monitoring points is included as Figure 1. Visual inspections are completed by both operations and engineering staff. The most recent settlement levels for Area 5 were measured on July 2<sup>nd</sup>, 2015. The survey data is given in Table 2, and the settlement at each point is given in Table 3.

As noted in Table 3, the average refuse settlement rate (measured in feet/month) for Area 5 continues to decline. For the approximate five month interval of February 9<sup>th</sup>, 2015 to July 2<sup>nd</sup>, 2015, the average rate was calculated to be 0.03 feet/month, versus 0.04 feet/month from the previous time period. This is approximately a 25% reduction in the settlement rate.

Also to note, no settlement due to erosion was observed in Area 5 during the 3<sup>rd</sup> Quarter of 2015.

Future plans for Area 5 are for continued filling to the approved 800 foot elevation. This filling will occur following the filling of Area 8, which was approved by the King County Council on Dec. 6<sup>th</sup>, 2010.

### **III. STORMWATER & LEACHATE MONITORING**

#### **Collection of Stormwater & Leachate Samples**

Samples were collected at stormwater sample location SW-S1, and leachate sample location LS-API during the 3<sup>rd</sup> Quarter of 2015. However, no samples were collected from the Area 5 Top Deck stormwater monitoring stations SW-A5TD1, SW-A5TD2, SW-A5TD4, SW-A5TD6 as there was no flow when the stations were checked. Therefore, no comparisons can be made with the stormwater or leachate samples, nor can a review be performed for evaluating exceedances for the 3<sup>rd</sup> Quarter of 2015.

### **IV. CONCLUSION**

Stormwater samples for the Area 5 Top Deck were not able to be collected during the 3<sup>rd</sup> Quarter of 2015 due to ‘No Flow’ conditions when the sampling stations were checked. This observation was in line with the overall regional precipitation levels for the quarter, which were substantially lower than historical levels. Therefore, no determinations can be made regarding Area 5’s stormwater runoff during the 3<sup>rd</sup> Quarter of 2015 with respect to exceedances of water quality criteria or benchmarks, nor can comparisons be made with background stormwater flow (from SW-S1), and leachate effluent (from LS-API).

Inspection reports however showed no issues with the interim cover system for Area 5. Additionally, Area 5 continues to settle at a declining rate, without any indication of major differential settling, nor signs of surficial erosion.

Regardless of the absence of stormwater runoff sampling results from Area 5 in the 3<sup>rd</sup> Quarter of 2015, the recent compliant historical performance trend for Area 5, coupled with on-going inspection results verifying the integrity of the cover all provides evidence that the Area 5 Top Deck Interim Cover System continues to function to prevent interaction between refuse and stormwater.

**State the needs of the repairs in the suggested remedy box.**

1. *Regulatory Priority* - permit, regulations & code & compliance driven.
2. *Safety Priority* – potential to adversely affect the safety of workers or the related environment.
3. *Maintenance Priority* – Ensures continuation of existing level of facility operations to ensure proper efficiency without interruption. This priority has the following four potential levels
  - a. *Emergency* - stops the continuing operation of the facility
  - b. *Urgent* – While not completely prohibiting continuing use of the facility, may threaten use of entire facility or continuing use may result in significant & extensive repair of facility.
  - c. *Routine* – need to be completed & not necessarily. May be completed under existing operations preventative programs.
  - d. *Deferred* – desirable but not required to maintain status quo operations (e.g., planting or wild life enhancement projects etc.)

Overall site description day of site inspection: Overall the landfill appears maintained. Construction of the new access roads, excavation of new roads and Area 8 development has generated a lot of dust and soil tracking onto harden surfaces. Contractors are a bit behind in the cleanup. The North leachate pond has been drained and sediment removed. An inspection of the liner revealed a couple of breaks in the liner. The breaks are above the average water level and are not a problem. Photos of the inspection can be found at:

P:\SWPublic\CHL\_Public\CH Monthly Site Inspections\SW inspections\SW Inspection 15\June 2015

<i>Category number:</i> F3 Area H, (2-3)	Action to be Completed. Suggested Remedy: (Area -8 Development), The contractors will be informed of the damage to the silt fencing that occurred during installation and they will be asked to make corrections/repairs or replacement of the damaged sections of the fence.
<i>Category number:</i> D6 Area H, (2)	Action to be Completed. Suggested Remedy: (Area -8 Development), The contractor will be asked to install silt fencing containment around stock piles of soils adjacent to the South stormwater pond.
<i>Category number:</i> G2 Area H, (2)	Action to be Completed. Suggested Remedy: (Area -8 Development), The contractor will be asked to install silt fencing containment around stock piles of soils adjacent to the drop inlet to the South stormwater pond.
<i>Category number:</i> F1 Area G, (3-4)	Action to be Completed. Suggested Remedy: (Area -8 relocated refuge), The contractor will be asked to install cover and silt fencing containment around deposits.

AREA CODES (for Cedar Hills)

G = Good

F = Fair

P = Poor

East Main Hill = EMH

Area 2/3 = A2/3

Aeration Ponds = AP

Area 5 = A5

Southwest Main Hill = SWMH

Area 4 = A4

So. Solid Waste Area = SSWA

Area 6 = A6

Southeast Pit Area = SEPA

Stockpile = SP

North Flare Station = NFS

Central Pit = CP

State the needs of the repairs in the suggested remedy box.

1. *Regulatory Priority* - permit, regulations & code & compliance driven.
2. *Safety Priority* – potential to adversely affect the safety of workers or the related environment.
3. *Maintenance Priority* – Ensures continuation of existing level of facility operations to ensure proper efficiency without interruption. This priority has the following four potential levels
  - a. *Emergency* - stops the continuing operation of the facility
  - b. *Urgent* – While not completely prohibiting continuing use of the facility, may threaten use of entire facility or continuing use may result in significant & extensive repair of facility.
  - c. *Routine* – need to be completed & not necessarily. May be completed under existing operations preventative programs.
  - d. *Deferred* – desirable but not required to maintain status quo operations (e.g., planting or wild life enhancement projects etc.)

Overall site description day of site inspection: Overall, the site appears clean and maintained. There is a lot of Good Fellow construction taking place and many things are in flux. Only three observations needing addressing are noted.

- 1) There is some leftover Good Fellow construction debris along the base shoulder of the new hill access road.
- 2) There is some damage to the fence line from tree limb fall located along the south perimeter access road.
- 3) There are two locations along the buffer fence line located north of Passage Point next to the cell phone towers that could use some additional rock. (Great job on grading and grubbing the buffer roads!).

Photos taken during the site inspection can be found at: P:\SWPublic\CHL\_Public\CH Monthly Site Inspections\SW inspections\SW Inspection 15\Sept 2015

# Gas Monitoring Reports

# DNRP / King County Solid Waste Serpentine Surface Monitoring Data

Landfill Site: Cedar Hills

Date: 9-14-15

Cal. Time: 1:00

Technician: D.W.

Surveyor PJ

### **Calibration :**

Test Instrument used: TVA-1000

Cal. Gas Lot No: 20328

**Cal Gas Used:**

**CH<sub>4</sub>** 494 ppm

O<sub>2</sub> Zero

Barometric Pressure	Time
Start 29.88	7:00
Stop 29.88	11:00

**90% response time in seconds:**

1    4    seconds

2 4 seconds

3 4 seconds

avg. 4 seconds

Weather Conditions: Overcast

## Wind Speed &

Direction (out of): 8 mph S

**Northing ( UTM # )**

Easting ( 10 T # )

## Time

## Comments

A grid diagram on lined paper. The grid consists of 12 horizontal rows and 5 vertical columns, creating 11 rectangular cells. A path is drawn from the top-left corner cell to the bottom-right corner cell. The path starts at the top-left corner, moves right through the first column, then down through the first row, and continues in a zigzag pattern across the grid. It passes through approximately 15 cells, ending at the bottom-right corner.

## **DNRP / King County Solid Waste Serpentine Surface Monitoring Data**

Landfill Site: Cedar Hills

Date: 9-14-15

Cal. Time: 11:00

O<sub>2</sub> Zero

Barometric Pressure	Time
Start 29.84	7:00a.m.
Stop 29.84	1:00p.m.

### **90% response time in seconds:**

1 5 seconds

2 4 seconds

3      4      seconds

avg. 4 seconds

Weather Conditions: Partly to Mostly Cloudy

## Wind Speed &

Direction (out of): 2 mph SE

**Northing ( UTM # )**

Easting ( 10 T # )

## Time

## Comments

A grid diagram consisting of 12 columns and 10 rows of squares. A single diagonal line runs from the top-left square to the bottom-right square, passing through the center of each square in its path.

# DNRP / King County Solid Waste Serpentine Surface Monitoring Data

Landfill Site: Cedar Hills

Date: 9-15-15

Cal. Time: 1:00 p.m.

Technician: Dye

Surveyor PS

### **Calibration :**

Test Instrument used: TVA - 600

Cal. Gas Lot No: 20328

**Cal Gas Used:**

**CH<sub>4</sub>** 496 pm

O<sub>2</sub> Zero

Barometric Pressure	Time
Start 29.86	1:00pm
Stop 29.84	4:30pm

**90% response time in seconds:**

$\frac{1}{4}$  seconds

$$2 \frac{4}{4} \text{ seconds}$$

3    4    seconds

avg. 4 seconds

Weather Conditions: Mostly cloudy

## Wind Speed &

Direction (out of): 4 mph SE

# **DNRP / King County Solid Waste Serpentine Surface Monitoring Data**

Landfill Site: Ceder Hills

Date: 9-18-15

Cal. Time: 7:00

Technician: Dye

Surveyor PJ

### Calibration :

Test Instrument used: TVA-1000

Cal. Gas Lot No: 20328

**Cal Gas Used:**

CH<sub>4</sub> 496 ppm

O<sub>2</sub> Antler

Barometric Pressure	Time
Start 29.86	7:00 a.m.
Stop 29.88	12:30 p.m.

**90% response time in seconds:**

$$1 \frac{4}{5} \text{ seconds}$$

$$2 \underline{5} \text{ seconds}$$

3          seconds

avg. 4 seconds

Weather Conditions: Partly cloudy

## Wind Speed &

Direction (out of): 1-2 mph SW

**Northing ( UTM # )**

**Easting ( 10 T # )**

## Time

## Comments

A graph plotted on a grid. A single, solid, black, downward-sloping line is drawn. The line starts at the top-left corner of the grid and extends towards the bottom-right corner, passing through several grid intersections. The grid consists of 10 horizontal rows and 5 vertical columns, creating a total of 50 smaller squares.

## **DNRP / King County Solid Waste Serpentine Surface Monitoring Data**

**Northing ( UTM # )**

Easting ( 10 T # )

## Time

## Comments

A graph on a grid showing two intersecting lines. The grid consists of 12 horizontal rows and 5 vertical columns. The lines are solid and black. One line starts at the top-left corner and slopes downward to the right. The other line starts at the middle-left column and slopes downward to the right, intersecting the first line. The intersection point is located in the second column from the left and the eighth row from the bottom.
