Influenza Update: May 2, 2020

During the week ending May 2, 2020:

- There was one new influenza-related deaths and no new outbreaks reported this week. Thirty-four deaths and 25 outbreaks at long-term care facilities have been reported this season (since 9/29/2019).
- Based on data from King County laboratories, rhinovirus was the most commonly identified respiratory pathogen. The percent of positive tests for respiratory viral pathogens was below levels observed this time of year and below peak levels observed during the previous five seasons. COVID-19 testing is not currently included in laboratory reporting of respiratory pathogens.
- During the week ending May 2nd, the percent of emergency department (ED) visits for influenza-like illness (ILI) was at or below baseline levels among all ages combined, and among each individual age group. ED ILI visits have been on a downward trend over the past five weeks following a peak in week 10. Among every age group except for adults ages 65 years and older, the percent of ED ILI visits overall this season is higher than observed during each of the previous five influenza seasons. The percent of ED ILI visits has been highest among pediatric age groups, peaking at or above four of the previous five influenza seasons. This season, the percent of admissions for influenza has been highest among adults ages 65 years and older, but below levels observed during each of the previous five influenza seasons.

Weekly Percent of ED Visits for Influenza-Like Illness

Note: The change from ICD-9 to ICD-10 codes in October 2015 may impact trends. Last updated May 3, 2020 ; 'current week' is week ending May 2, 2020 Baseline: Mean % ILI during non—flu weeks for previous three seasons, adding two standard deviations. A non-flu week is a period of 2+ consecutive weeks where each one accounted for <2% of the season's total number of specimens that tested positive for influenza by PCR.

National data from CDC

A Weekly Influenza Surveillance Report Prepared by the Influenza Division Influenza-Like Illness (ILI) Activity Level Indicator Determined by Data Reported to ILINet

2019-20 Influenza Season Week 17 ending Apr 25, 2020

All ages

This ring uses use projunted or outplaned visits to readificate provises for interestance miles to measure the cit. activity level within a state. Therefore, outbreaks occurring in a single city could cause the state to display high activity levels.

"Data collected in ILINet may disproportionately represent certain populations within a state, and therefore may not accurately depict the full

picture of influenza activity for the whole state

*Data displayed in this map are based on data collected in ILINet, whereas the State and Territorial flu activity map are based on reports from

state and territorial epidemiologists. The data presented in this map is preliminary and may change as more data is received.

"Differences in the data presented by CDC and state health departments likely represent differing levels of data completeness with data presented by the state likely being the more complete."

Please report any of the following:

- Laboratory-Confirmed influenza-associated deaths
- Patients with novel or unsubtypable influenza viruses
- · Outbreaks of influenza-like illness in a long-term care facility
