Amanda,

We are requesting an extension for the submittal of the Blasting plan until February 8th so that any relevant findings from the geotechnical analysis we have commissioned on the steep slope area can be incorporated into the Blasting Plan. As we discussed previously in person, we believe the geotechnical report will be completed on or around February 1st, and it will take a few days for ERP to make any final updates to the Blasting Plan as well as obtain our sign off along with legal counsel.

Additionally, and further to our earlier email, an ESD survey was completed by Core Design this week and results of that survey should be available soon for review by our Traffic Consultant. The current deadline for submittal of proof surrounding the required ESD is January 19, 2019. We are requesting an extension of that deadline to February 8th, so that additional submittals based upon the ESD survey can be prepared.

As you know, with regard to the request for a revised TIR, our engineers are still working with KC to try to obtain the requested relevant documents, thus it is highly likely we will need to request additional time for meetings and submittals surrounding that request. Once the requested documents are available from KC, we will have a better understanding of the timeframes needed and will send you a separate email to discuss those issues.
